March 1, 2005

Introduction

This brief report documents vascular plant species we (the authors) observed at Mount Rushmore National Memorial (MORU) in 2003 and 2004 to help complete the vascular plant inventory of MORU for the Northern Great Plains Network (NGPN) of the National Park Service's Inventory and Monitoring Program. Although the NGPN Inventory plan showed that approximately 82% of vascular plant species expected to occur at MORU had been documented (National Park Service 2002), later inspection of the species list suggested that the list of expected species was incomplete. Therefore, further work was needed to make a more complete inventory. Dan Licht, NGPN coordinator, asked that I (A. Symstad) assist with this.

No formal agreement or scope of work was written for the work presented here. Instead, for the most part, the work was done as a supplement to a project investigating the extent of old growth ponderosa pine forest within MORU's boundaries. Therefore, this report is somewhat informal, but will serve as a record for documentation purposes.

Methods

In this project, Mike Bynum (a technician hired for the old growth project) and I visited 171 points located systematically throughout the park (Figure 1) between July 1, 2004 and September 15, 2004. Prior to the study, Marcia Wilson (NGPN biotech and NPSpecies coordinator) provided us with a list of documented and expected species for the park, which she compiled from the Inventory Plan (National Park Service 2002) and later documentation. While we were walking to or working at the old growth study points, we recorded species observed in the field that were not on the list provided to us; we also recorded species listed as expected but previously undocumented. Per Mr. Licht's instructions, a specimen was not collected for every species observed. When we were not 100% certain of the identification of a plant in the field, we collected one or more specimens, which we later identified in the office. Fifty-four specimens that we did not have time to identify were later identified by Hollis Marriott. All specimens that we collected for this inventory will be placed in the MORU herbarium. (A file including information on these specimens, from which specimen labels will be printed, is supplied with this report.) In addition, I sometimes checked off species that were already on the list. Usually this was done for less common species that had a relatively low level of documentation.

In addition to the species recorded as part of the old growth study, some were recorded during specific "inventory" searches. There were two of these: (1) we spent one day in late June 2004 concentrating on the Highway 244 roadside between Iron Mountain Road and the parking ramp at the park; and, (2) I spent two days in May 2004 along or in the vicinity of the Blackberry trail. I also made a limited number of other observations during other outings in the park in 2003.

Results and Discussion

Due to our lack of expertise in identification of ferns, sedges, and rushes, I feel it must be stated that I am not at all confident that we did an adequate job of inventorying species in these groups.

In summary, we recorded 238 vascular plant species and collected 104 vouchers. Of those recorded, 132 had not previously been documented in the park. Since the Inventory Plan listed 132 species as documented and only 24 more expected, the Inventory Plan for this park was obviously incomplete. The work that we did should bring the park much closer to the target

of documenting 90% of the expected species. We feel it was quite thorough given that it was a secondary goal of the old growth forest project. More species might be documented, however, if a greater portion of the park were botanized early in the growing season (late May to early June) and if the botanist was good with sedges, rushes, and ferns.

The bulk of the information of this report is in Table 1, which lists the species that we recorded. It is not a complete species list for the park, as our main goal was to supplement the list of species that were already documented. Two files are supplied with this report.

“MORU_plant_inventory.xls” includes one worksheet with the information in Table 1 and one worksheet with the specimen information. “MORU FINAL plant cert file annot by Amy.xls” is a modification of the plant certification file sent to Marcia Wilson by Hollis Marriott. I annotated this file by (1) adding some species that we had specimens for but were not previously reported; (2) noting dates that observations were made for species listed as “probably present”; and, (3) correcting a few problems due to the preliminary list.

Acknowledgements

Hollis Marriott provided specimen identification for approximately half of the vouchers we collected. We thank her for her help with these.

Figure 1. Locations of plots visited in course of old growth study within Mount Rushmore National Memorial (boundary shown in green). Numbers under points are plot names, often referred to in voucher collections.

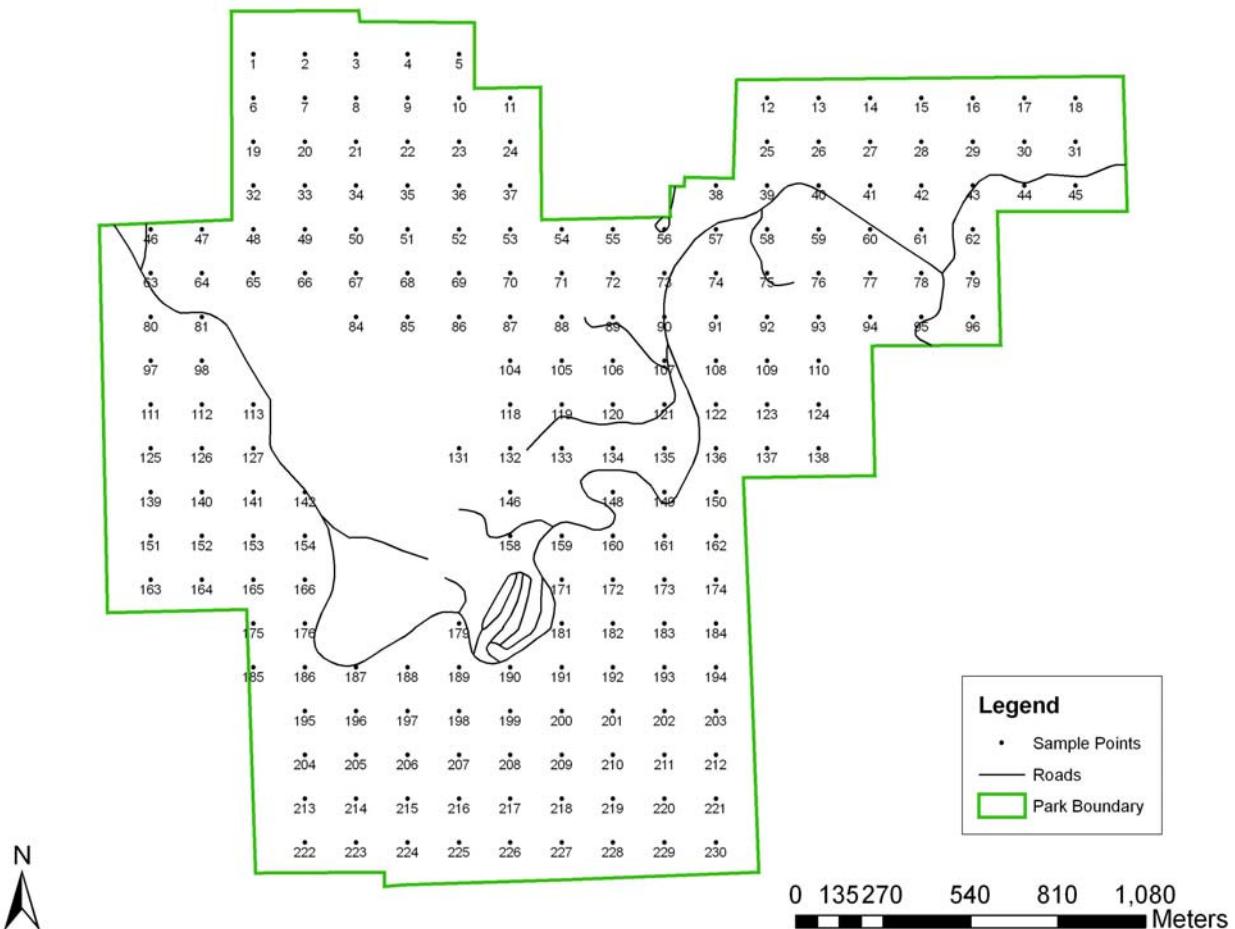

Table 1. Complete list of species recorded by the authors within Mount Rushmore National Memorial boundaries in 2003 or 2004. Species nomenclature follows that of the Integrated Taxonomic Information System (www.itis.usda.gov). In the table, the date recorded in the “Date” column is the first date that it was observed or specimen collected. In the “Voucher” column, “n” indicates that the species was not previously documented, but no voucher was collected; “x” indicates that the species was previously documented and no voucher was collected; “ERROR” indicates that the species was erroneously reported as occurring in MORU in a preliminary species list and should not be included in the final certified list; and one or more numbers indicate the voucher number as referred to in the accompanying file (MORU_plant_inventory.xls; “Voucher specimens” worksheet). In the “Corrections or other notes” column, notes are of three types: corrections to previous misidentifications that may have led to errors in the current NPSpecies file; notes of locations that may indicate that the species was introduced to the park as part of a revegetation effort; and miscellaneous.

Family	Species	Date	Voucher	Corrections or other notes
